SEH Technology Introduces myUTN-150

Next Generation of USB Device Servers for Professional Networks

PHOENIXVILLE, PA (January 30, 2012) – SEH Technology, a leading network solutions provider, extends its USB device server series by introducing the myUTN-150. The myUTN-150 USB device server offers assignment and port key control for the safe management of attached USB devices. Plus, the myUTN-150 USB device server is ready for operation in Virtual Local Area Networks (VLAN), in virtual environments, and Gigabit networks. The myUTN-150 USB device server is now available for the recommended retail price of \$499.99.

The IPv6-enabled myUTN-150 Gigabit USB device server is a virtual USB solution for up to three USB devices. It offers a cost effective solution for sharing USB devices among several users across the network or for the exclusive and safe assignment of USB devices to one user.

“The myUTN-150 bridges the gap between the world of USB and enterprise networks, including virtual environments (VMware, Citrix, Microsoft Hyper V),” states Mike Majewski, President of SEH Technology. “With its management and security features, myUTN-150 is designed for professional networks.”
